

## Key Features on your iPad or iPhone -- iOS 5

### Split Keyboard

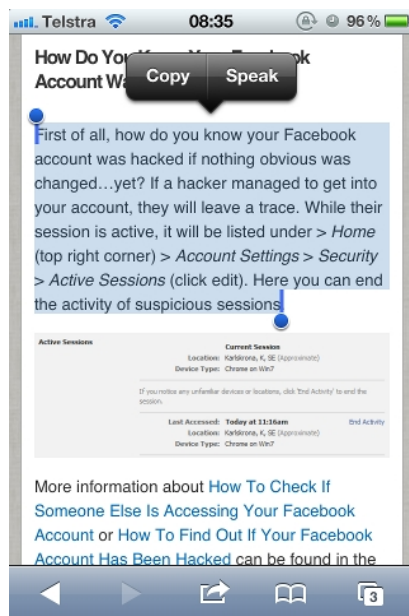

The split keyboard now lets you split the keyboard into two parts, so whenever you're holding the iPad from its sides, the keys on the keyboard are within your thumbs' reach. You can also undock the keyboard and move it up and down the screen in case it hinders what you're trying to view.

Either, touch and hold the "hide keyboard" icon, lower right screen, or swipe with each index finger from the center of keyboard >>outward

### Built In Dictionary

Select a word in notes, messages, website content or any 'selectable text' by touching and holding, and choose **Define** from within the bubble that pops up over it.

### Speak Selection

Found under **Settings, General** then **Accessibility** (needs to be enabled before you can use).

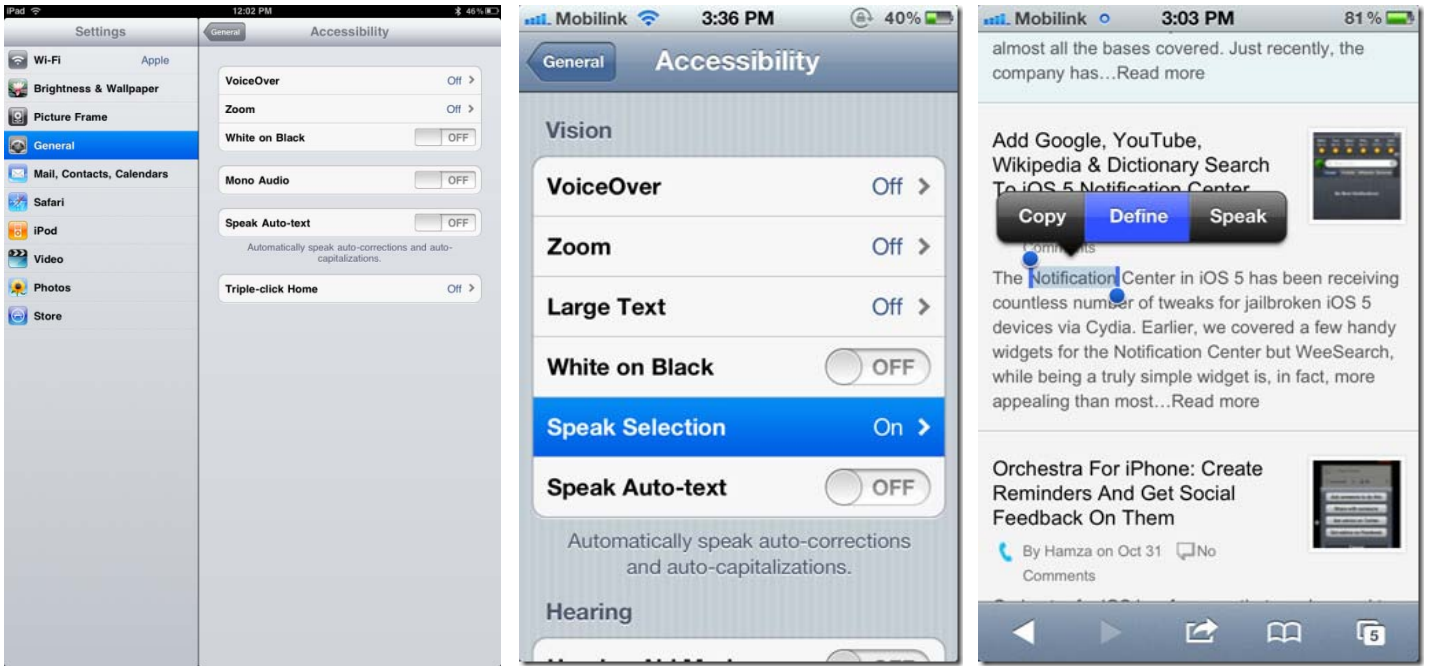

Speak Selection adds a "Speak" option to any text that you select (be it a webpage, an email or a message you're still typing) before reading the whole thing back to you at a swift pace. The speaking rate can be modified.

## Voice Over

Found under **Settings**, **General** then **Accessibility** (needs to be enabled before you can use).

VoiceOver is another potentially useful speaking option, and one that is especially handy for those with poor eyesight who have difficulty navigating their device. This feature simply reads aloud from the screen you are on, listing options and other

notes.

## Text Expansion

Consider this your dictionary for the keyboard's auto correct feature. Here, you can add words of your choice that will be autocorrected to what you want. This is especially useful for larger words or even whole phrases. For example "omw" could automatically translate to "On my way".

## Gestures

**Four- or Five-Finger Vertical Swipe** Like a double-press on the Home button, a 4 - or 5-finger upward swipe will pull up the multitasking bar along the bottom of the screen. To return it, swipe downward (or single-tap anywhere above it).

**Four- or Five-Finger Horizontal Swipe** With a 4 - or 5-finger horizontal swipe, you can quickly move between most recently used apps. For example, if in Safari, perform a 4 - or 5-finger horizontal swipe left or right to move to another recently used app; it's similar to the one-finger swipe you use to move between home screens. You can swipe only between apps that have recently been used.

**Four- or Five-Finger Pinch** When in an app - to quickly return to the home screen, use a 4 - or 5-finger pinch gesture. (Same thing as clicking the Home button.) Start with 4 or 5 fingers outward, and then pinch them together. Depending on the speed of your pinch, you can slowly shrink the app or have it disappear quickly. This gesture has no reversal option; to reopen a recently closed app, you'll have to pull up the multitasking bar.

**Gestures in AssistiveTouch** If you have trouble with (or aren't capable of performing) these or other gestures, you can use the new AssistiveTouch feature in iOS 5. With AssistiveTouch, you'll be able to access a menu overlay to trigger any of iOS's multi-finger gestures by performing a one-finger tap. You can also create, save, and play back custom gestures.

Assistive Touch

## Restrictions

It allows you to disable many of the device's built-in apps and features—including Safari, FaceTime, location-based features, and more and it lets you choose what kind of media the can access. This requires password activation, so choose something you will remember, but that the user will not decode!

Oldies but Goodies: Features you may have missed before....

Search for an App: Swipe all the way to the left of the home screen, to find the search feature

Recently Used App Menu: Double tap the “home” button to bring up bottom bar of recently used apps.

Group apps: Press and hold any app to make them all “selectable”. Now press and hold one app, while dragging over the top of another. This creates a group – give it a customized name.

Lock the Orientation: Go to Settings > General > Lock Rotation. Now the side button on the device will activate the lock rotation option.

Screenshot: Briefly press the Home button and the Power (Sleep/Wake) button at the same time. The screen will flash white, and an image of the current screen will be saved to your Photos.

On Screen Keyboard shortcuts: Press and hold any key on the on-screen keyboard to see other functions of that key. This avoids having to toggle between keyboard layouts.
